SKIPIT

New Way Of Defi

It all started in 2020 when The Decentralised Finance (Defi) market experienced spectacular growth. we were looking for defi tokens to invest in. Later we discovered that we could have gotten much more profit if we would have staked or farmed our tokens. Then we started to look deep into these Dapps, we were afraid to touch those apps cause it was complicated. But we decided to explore it.

even though we know how to use Dapp didn't make any difference. it was very difficult because the Dapp was complicated and different from centralized exchanges and other apps we used before. The UI/UX was complicated. From that moment, I had the idea that why don't we build a Dapp that is more user-friendly without losing its decentralized properties.

so we planned to look for web3 projects / Dapps with such features and we were disappointed with the result. when we say Dapp developers or projects just building the security apps and of course, it has decentralized features but they make it too complicated to use.

We have different L1 projects and L2 projects but the apps that are building are the same.

When we started to dig deep into Defi, we realise we need an extra notebook to calculate the gas we spend. There were no automated features to measure the gas spend on any Decentralized exchange.

This is where the kushina project is born. We are building a Decentralized platform where users will get features that same as a centralized platform without losing its feature.

After reading the whitepaper you will be asking your self am I reading a whitepaper or an essay, cause this is not what a normal whitepaper looks like. It should be filled with complicated words.
kushina was born to change the view of defi projects. If Defi wanted to be an evolutionary thing then it should be easy or at least we have to make it simple. That is why we break the complicated

part and made a simple whitepaper so everyone can understand our project.
we believe in community and that is why we used a different name and different category for our project because,

kushina waifu is the new way of defi.

if you check the uniswap or total dex trade volume it is increasing comparing to previous year. but if you compare Dex volume with Cex it is still very low.

UPDATED: MAY 29, 2022

above chart from theblockcrypto.com shows that we are still have long way to go.

key focus

kushina new way of defi

1 user friendly UI/UX

2 human readable activity

3 reducing tech abstracted

1 kushina swap is a one-click swap where users can do whatever in a single click than doing 5-10 steps without losing its transparency.

2 Kushina swap will do the work from behind with transparency so that every user can check and confirm the process.

3 Kushina swap dashboard will contain Insights of the user's trade, fees the user spent, etc… and users can disable the features without compromising other features in kushina swap.

kushina swap

New Way Of Defi

we know our community will be the best and they will help others in using kushina swap but we will also try to bring 24x7 customer service in the future to avoid scammers from scamming the community.

behind the scene

when we say one click Decentralized exchange we are not skipping the methods, instead, we are using smart contracts to do the work for you, and for each transaction, users need to pay gas fees to miners.
we will be launching in the Binance chain to reduce the fees. we will also focus on finding new ways to bring the kushina swap to another chain without paying huge fees.

BUILDING THE PROJECT

2022

Tokenomics

kushina token is a bep-20 token with limited supply

1 TRILLION max supply

40% sale

50% liquidity

10% marketing

why tax ?

Kushina waifu is a meme + defi token where you get feature of both in simple token. kushina token can't be minted so staking / farming will be not that effective. To solve this we have bring the tax system ;
4% to holder
1% to liquidity pool
1% to treasury

Vision

kushina token can't be minted and kushina swap will run by the fees that we got from users.
The fees will be collected and will transfer to the treasury so that we don't have to depend on the fees all the time.

kushina swap don't stop by these features. we will add features time by time. we will upgrade the kushina swap so that you can use it on every chain. We can't say what will happen in 1 year so we will move along with time and technology.

Timing

why now ?

we are lauching the project in bear market. we belive in our project. we are not here for a life circle. we are here for end of the Defi.

Future Roadmap

building kushina swap and adding features is our main goal.
we may make the progress fast than mention

kushina swap.

Q3 2022

single tap liquidity.

Q4 2023

single tab staking

Q2 2023

bride function

Q4 2023

Competitor Approach

Our product and features

our product will attract users and every time we add new features we will make a marketing campaign to spread the word through community rather than promoted posts.
